

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1-6. canceled.

7. (previously presented): A fluid dispenser comprising:

a fluid reservoir (10) serving to contain fluid; and

a dispenser head (2) mounted on the reservoir (10) to take fluid from the reservoir, said head (2) defining a dispensing chamber (26) communicating with the reservoir via an inlet valve (25, 215) and communicating with the outside at a dispensing orifice via an outlet valve (237, 222);

wherein the chamber (26) is defined by at least one elastically deformable actuating wall (231) that is depressed radially inward in order to generate a pressure inside the chamber that is high enough to close the inlet valve and to open the outlet valve;

wherein the head (2) further comprises a rigid tube (22) having a fastening end (277) and an opposite end (222) forming an outlet valve seat; and

wherein the actuating wall (231) is formed by a sleeve (23) extending around the tube (22).

8. (original): A dispenser according to claim 7, in which the tube (22) defines an internal volume (262) in which the inlet valve (25, 215) is received, the internal volume communicating

with a peripheral volume (263) that extends around the tube inside the sleeve (23) via at least one through opening (233), the dispensing chamber (26) including the internal volume (262) and the external volume (263).

9. (previously presented): A dispenser according to claim 7;

in which the tube (22) is fastened to a body (21) of the head via the fastening end (227), the sleeve (23) being fastened to the tube and to the body via anchor means (234).

10. (previously presented): A dispenser according to claim 1, in which the reservoir is airless, i.e. it does not have any air intake.

11. (previously presented): A dispenser according to claim 7, in which the reservoir (10) is elongate and is preferably in the form of a fine tube.

12. (previously presented): A dispenser according to claim 7, having the general shape of a pen that can be grasped in the hand in the manner of a pen, so that at least one finger of the hand is placed on the actuating wall (231) with the dispensing orifice disposed at the tip of the pen.

13. (previously presented): A dispenser according to claim 7, in which the sleeve (23) is surrounded by a substantially rigid sheath (24') that defines at least one window (245) giving access to the actuating wall (231).

14. (previously presented): A dispenser according to claim 7, in which the sleeve (23) is provided with a cap (25; 28) preventing access to the actuating wall.

15. (previously presented): A dispenser according to claim 13, wherein the sleeve (23) is provided with a cap (25; 28) preventing access to the actuating wall;

in which the cap (25) is mounted to turn on the rigid sheath (24') and is provided with at least one opening (255) serving to come into register with said at least one window (245) in a manner such as to enable the actuating wall to be accessed through a window and through an opening, with the window and the opening being mutually in register.

16. (original): A dispenser according to claim 14, in which the cap (28) has a collar (284) in contact with the sleeve.

17. (previously presented): A fluid dispenser comprising:
a reservoir for containing fluid;
a tube mounted on the reservoir;
an inlet valve disposed inside of the tube for selectively drawing fluid from the reservoir;
and
an elastically deformable sleeve surrounding the tube, wherein the elastically deformable sleeve is deformable radially inward;
wherein a space between the tube and the elastically deformable sleeve defines a dispensing chamber; and

wherein an outlet valve for the dispensing chamber is formed by the tube and the elastically deformable sleeve;

wherein the fluid dispenser is actuated by radially deforming the elastically deformable sleeve to increase the pressure in the dispensing chamber, thereby closing the inlet valve and opening the outlet valve.

18. (previously presented): The fluid dispenser according to claim 17, wherein the elastically deformable sleeve forms both an outlet for the dispenser chamber and a dispenser orifice from which the dispensed fluid can be collected.

19. (previously presented): The fluid dispenser according to claim 18, wherein the sleeve is flush with the tube in a longitudinal direction of the tube, such that the dispenser orifice is formed at a distal end of the tube.

20. (previously presented): The fluid dispenser according to claim 17, wherein the distance between a distal end of the tube and the fluid reservoir remains constant during actuation of the fluid dispenser.
